

INTERNSHIP REPORT

A report submitted in partial fulfillment of the requirements for the Award of Degree of

BACHELOR OF ENGINEERING

(ELECTRONICS & TELECOMMUNICATION)

By

Kumbhar Akansha Sachin

Roll Number: 3156

Under Supervision of

Prof. Vipul Kayate

Edunet Foundation – Next Gen Employability Program

Duration :22 Dec2025 To 16 Jan 2026

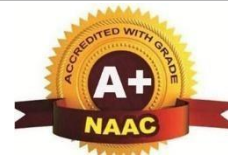

DEPARTMENT OF ELECTRONICS & TELECOMMUNICATION

(Accredited by NAAC „A+“ Grade)

PUNE - 411 048

A.Y. 2025-2026

CERTIFICATE

This is to certify that the “Internship Report” submitted by **Kumbhar Akansha Sachin**, Roll Number **3156**, is the original work done by him/her during the academic year **2025–2026**.

The internship was completed at **Edunet Foundation – Next Gen Employability Program, Pune**, from **22/12/2025 to 16/1/2026**

This report is submitted as a part of the requirement for the award of the degree of **Bachelor of Engineering in Electronics and Telecommunication Engineering**.

Dr. T. G. Thite

Departmental Internship Coordinator

Dr. D. D. Kulkarni

Head of E&TC Department

Date: _____

Place: _____

Internship Objectives

The *Golden Year Network Alumni Application* is designed to create a digital platform that strengthens communication and collaboration between alumni, students, and the institution. The primary objective of this project is to develop a structured and user-friendly web-based system using HTML, CSS, JavaScript, Spring Boot, Java, and MySQL to manage alumni information efficiently and support networking opportunities. This project focuses on implementing secure user authentication, database management, role-based access control, and interactive interfaces to enhance user experience. It also aims to provide practical exposure to full-stack web application development, backend integration, and real-world deployment practices while improving problem-solving skills and collaborative development using modern tools and technologies.

1. To understand the fundamentals of web application development using Django and MySQL.
2. To learn backend development and database integration for managing users and tasks.
3. To design and implement a task and workflow management system.
4. To implement user authentication and role-based access control.
5. To improve technical skills and problem-solving ability in full stack development.
6. To gain experience in version control using GitHub for Collaborative Project Development and Management.

Company Profile

Background

Edunet Foundation is a skill development and training organization that provides industry-oriented learning programs in collaboration with technology partners. It focuses on improving students' employability skills through practical exposure to emerging technologies such as Full Stack Web Development and Artificial Intelligence.

The Next Gen Employability Program bridges the gap between academic knowledge and industry requirements by offering hands-on project-based training. During this internship, students gained practical experience in web application development using the Django framework along with database integration and teamwork in a real-time development environment.

Organization Structure

The organizational structure of the Edunet Foundation training program is as follows:

1. **Program Coordinators** – Manage internship activities, schedules, and overall program execution.
2. **Technical Mentors / Trainers** – Provide guidance on full stack development concepts, tools, and project implementation.
3. **Project Team Members (Interns)** – Work collaboratively on designing and developing web applications such as the Team Flow system.
4. **Support Team** – Assist in technical resources, documentation, and coordination of training sessions.

The organization provides a structured learning environment where interns gain practical knowledge through guided training sessions and real-time project development activities.

Technology / Tools / Methodology Studied

During the internship training, various web development technologies and tools were studied. The main focus was on developing a **Task and Workflow Management System (Team Flow)** using Django framework with database integration and role-based authentication. The training involved learning backend development, frontend design, and real-time project implementation.

1. Python Programming Language

Python was used as the primary programming language for backend development. It helped in building server-side logic and handling application functionality efficiently.

During the internship, the following concepts were studied:

- Variables and data types
- Conditional statements and loops
- Functions and modules
- Object-oriented programming concepts
- File handling basics

Python provided a strong foundation for developing scalable web applications using the Django framework.

2. Django Framework

Django framework was used for developing the backend of the TeamFlow system. It supports rapid development and clean project structure.

The following Django concepts were studied:

- Project and application structure
- Models for database handling
- Views and templates integration
- URL routing system
- Django Admin Panel usage

Django helped in implementing secure authentication and managing application data efficiently.

2. Frontend Technologies

Frontend technologies were used to design the user interface of the TeamFlow system.

The following technologies were studied:

- HTML for page structure
- CSS for styling web pages
- Bootstrap for responsive design
- JavaScript for interactive elements

These technologies helped in creating user-friendly dashboards and task management interfaces.

3. Database Management (MySQL)

Database systems were used to store and manage application data such as user details, tasks, and workflow status.

The following database concepts were studied:

- Creating tables and relationships
- Performing CRUD operations
- Managing user records and task data
- Connecting database with Django framework

Database integration ensured efficient storage and retrieval of project information.

4. Authentication and Role-Based Access Control

Authentication system was implemented to manage secure login functionality for different users.

The following features were implemented:

- User registration and login system
- Role-based access (Admin, Manager, User)
- Secure password handling
- Dashboard access control

This helped in maintaining system security and proper workflow management.

5. Project Development Methodology

The methodology followed during the development of the *Golden Year Network Alumni Application* involved analyzing project requirements and designing the system architecture based on identified features such as alumni registration, profile management, and communication modules. The database structure was created using MySQL, and backend functionality was implemented using Spring Boot and Java. The frontend interface was developed using HTML, CSS, and JavaScript to ensure a user-friendly experience. Integration between frontend and backend components was carried out for smooth data processing, followed by testing, debugging, and final deployment of the application. This approach helped in gaining practical experience in full-stack web application development.

The methodology followed during the internship included:

- Understanding project requirements and workflow design
- Designing database structure and application modules
- Implementing backend logic using Django framework
- Developing frontend interface using HTML, CSS, Bootstrap
- Testing and debugging application modules
- Deploying and demonstrating the Team Flow system
- This approach helped in developing practical knowledge of real-time web application development.

Project Work Carried Out During Internship

During the internship training, a real-time web application project titled **Team Flow – Task and Workflow Management System** was developed using Django framework along with frontend technologies and database integration.

The following modules and functionalities were implemented during the project development:

1. **User Authentication System** – Implemented secure user registration, login, and logout functionality using Django authentication.
2. **Role-Based Access Control** – Designed separate access levels for Admin, Manager, and User to ensure controlled system operations.
3. **Task Creation Module** – Developed functionality for managers to create and assign tasks to team members.
4. **Task Assignment System** – Enabled assignment of tasks with deadlines and priority levels.
5. **Task Status Update Feature** – Implemented options for users to update task progress such as pending, in-progress, and completed.
6. **Admin Dashboard** – Created dashboard for managing users, monitoring activities, and controlling workflow.
7. **Manager Dashboard** – Designed interface for assigning tasks and tracking employee performance.
8. **User Dashboard** – Developed personalized dashboard for viewing assigned tasks and updating task status.
9. **Database Integration** – Connected application with SQLite/MySQL database for storing user and task information.
10. **Frontend Interface Design** – Designed responsive web pages using HTML, CSS, Bootstrap, and JavaScript.
11. **Django Admin Panel Usage** – Managed users, roles, and task records through Django Admin interface.
12. **Error Handling and Validation** – Implemented input validation and error handling for secure data processing.
13. **Testing and Debugging** – Performed functional testing of modules to ensure smooth application performance.
14. **Version Control using GitHub** – Maintained project source code and tracked updates using GitHub repository.
15. **Project Documentation** – Prepared technical documentation describing system architecture, modules, and workflow.

Outcomes / Learning from Internship

The internship provided valuable practical exposure to full stack web development using modern technologies such as Python, Django, HTML, CSS, Bootstrap, JavaScript, and database integration. During the training period, theoretical knowledge gained in academic studies was applied to real-time project development through the implementation of a Task and Workflow Management System.

During the internship, knowledge about backend development using the Django framework was gained, including working with models, views, templates, and URL routing. Practical experience in database integration was also obtained using SQLite/MySQL for managing user data and task information efficiently.

The internship also provided an understanding of frontend interface design using HTML, CSS, Bootstrap, and JavaScript. It helped in developing responsive web pages and user-friendly dashboards for managing tasks and workflow activities effectively.

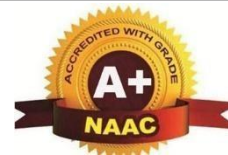

The training further helped in implementing role-based authentication systems with different access levels such as Admin, Manager, and User. This improved understanding of secure login systems and access control mechanisms in real-world web applications.

During the development and testing phases, errors were identified and corrected, which helped in improving debugging and problem-solving skills. Practical experience in version control using GitHub and collaborative project development was also obtained during the internship period.

The internship also enhanced understanding of structured software development methodology, including requirement analysis, system design, module implementation, integration, and testing. It helped in learning how real-time applications are developed following systematic development practices.

In addition, the internship improved teamwork, communication skills, and confidence in working in a collaborative development environment. Exposure to project documentation and workflow planning further strengthened professional skills required for software development projects.

Overall, the internship significantly improved technical knowledge and practical skills in full stack web development. The experience gained during the internship will be beneficial for future academic learning and for building a professional career in software development and backend engineering.

Feedback from Internship Supervisor

During the internship period, the performance of the student **Akansha Sachin Kumbhar** was observed. She showed sincere interest in learning full stack web development concepts and actively participated in the development of the **TeamFlow – Task and Workflow Management System** using the Django framework.

She demonstrated a positive attitude toward learning and gained practical knowledge of backend development, frontend technologies, and database integration. She was disciplined, punctual, and cooperative while working with mentors and fellow trainees.

Overall, her performance was satisfactory, and she successfully completed the internship training. We wish her success in her future academic and professional career.
